Biometric Corporation Debuts Patented GPS Tracking Solution

Dallas TX, June 06, 2003 – Biometric Corporation announces the debut of the patent pending GPS tracking addition to the ParoleTRAX System. gpsTRAX will locate and track individuals by using the Assisted Global Positioning System through an enabled cellular telephone combined with Biometric's field proven voice verification engine. Since the solution uses a readily available, mass produced cellular telephone, the cost is minimal for a real-time tracking solution, and the standard telephone provides privacy for the client being tracked. The system positively verifies that the individual carrying the phone is the person being tracked using Biometric's voice verification and random paging engine. Alerts can be sent to the administering personnel based on their desires. The ParoleTRAX System provides real-time information about the identity and location of individuals by utilizing a combination of voice verification/recognition technology and the telecommunication network.

"This system will revolutionize community based tracking for parole, probation and pre-trial" states Kurt Schuder, Director of Engineering. "It is exciting to be the first to introduce this critical new technology" adds Schuder.

Headquartered in Dallas Texas, Biometric Corporation is a privately held Texas corporation that develops community based electronic monitoring and GPS tracking solutions for the corrections industry. For more information please visit www.biometric-corp.com or call 800-936-5031.
